

Industrial Air Compressors

Rotary Screw & Piston Oil Injected Air Compressors 4 KW to 250 KW

Tamsan Compressor was established in 1980 to produce air compressors and associated spare parts and components. In the first few years, universal lathes were used in Tamsan Compressor's 800m2 facility. However, taking advantage of developing technology, the company soon adopted CNC (computer numerical control) machinery. The benefits of this equipment in our production environment were improvements in standardisation, better product quality and reductions in cost.

Increasing sales required Tamsan to increase the production area from the original 800m2 up to 8000m2 in 2008. Thanks to its emphasis on quality, Tamsan now exports its air compressor products to many countries around the world, and is particularly successful in Europe. With increasing exports of high quality products, Tamsan's name and reputation are becoming more familiar in the world of compressed air as each day passes. The standard range of oil-flooded rotary screw compressors now includes over 80 different machines and continues to expand.

Furthermore, by developing and exploiting its associations with industrial and academic partners, Tamsan aims to bring new products and technologies to market. As a pioneer brand in its sector, Tamsan envisages continued growth in sales, a widening of its product portfolio, and a consequent increase in world-wide market

TAMSAN TV SERIES AIREND

Circumferential Speeds

The Speed design point has been optimised and its clearly lower when compared to previous stages

Minimum Tolerance

Due to the low Tolerance the stage has a long service life and efficiency losses are minimized

Optimized Design

Tamsan Airend design is optimized values. This prevent overcompression and backflow that causes high losses

- Increased Performance
- Long time Bearing Life
- Direct Drive Compability
- Belt Drive Compability
- Reduced Noise Level
- 2 Years Warranty with Unlimited Working Hours

Large Bearings

High quaility bearings have been selected in largest possible size.

Oil Injection

The Oil Injection is designed for optimum cooling effect and minimum splash losses

Asymetric Profile

Tamsan oil-injected airend units are specially designed that ensures maximum efficiency. The gap, between the male and female rotors is reduced to minimum level and excellent efficiency is achieved.

Steel Rotors

The most important component of a screw compressor is the airend unit. The quality of these airend units are directly proportional to the quality of the compressor. Wendel prefers to use steel rotors in airend units after end of the duty R&D studies. The compatibility of the housing with the rotors has been increased to a maximum level.

T & TK SERIES

Rotary Screw Air Compressors Includes Air Receiver & Air Dryer

TVK 550 T, TVK 800 T, TVK 1100 T, TVK 1900 T, TVK 2500 T

TVK 550 TK, TVK 800 TK, TVK 1100 TK, TVK 1900 TK, TVK 2500 TK

Extra Protection

11 KW and 15 KW series air compressors use same type cabinet. Asymetric profiled airend group is driven by the bearings that is highly resistant against dust. This airend group that is driven by belt and pulley work silent due to the structure of bearing and profile. These compressors have very long bearing maintenance time, which work more efficiently than the screw groups of competitors. These compressors that have cabin cover system are easy to service also facilities save money and time.

Electic control unit get info to the operator regarding, warnings, fault codes and maintenance time of the compressors.

Compact Design

"IK series" compressors are compact design compressors including compressor, air tank, dryer and filters. In TK series, compressor and dryer are mounted on the same air compressor. Moisture of pressured air is separated by the dryer while compressor running and sent to air tank. Eventually, dry air is delivered to the system and lifespan of the air tank is extended.

Plug & Play

One of the most significant features of TK series compressors is easy usage. These compressors are "Plug&Play" compressors. Just by connecting compressor to electricty, you can start having pressured air in your facility.

Air Dryer

Reliability

Digital Control Panel

Tamsan Rotary Screw Air Compressors are equipped with analogue or digital control panel options according to user preferences.

When you need to use the compressor, just push the start button. Temperature, pressure and other important data can be monitored from the control panel.

If compressor encounters a trouble, it protects itself against any damage that may occur and stops. Also You can see the warning signals from the control panel.

- **Optional Specifications**
 - **Direct Drive**

 - Silencer

18,5 KW and 22 KW series air compressors use same type cabinet. These series use TV-7 Airend and turnover rate is up to 3800 rpm in these compressors. Airend lifetime is longer that work is low speed without any fault. The flow loss rate is reduced to zero due to the selection of larger suction group than its competitors.

Absorbed air pass in to the precision filter after the pre-filtration that is stated at the cabin. Pre-filtering is more important for life time of air compressor.

Airend bearings are durable, consume less energy at the same time noiseless working systems. It protects durability even in dusty ambience, also it prevent against locking and wrapping of motors. Especially, Our Airend groups provide 13 bar that we use familiar brands as SKF, TIMKEN and FAG.

LONG LIFE & ENERGY SAVER

30KW and 37 KW Series Tamsan Compressors are economic and also they use high efficiency new generation profile and airend group that is driven by belt and pulley. These series use TV-8 Airend. These airends has long life bearings due to it has low rotation speed. This airend group has more than Long lifetime, additionally noise level is minimum.

Pulley group are equipped with cooling system. These types of pulleys minimize energy the loss additionally cooling channel extend belt life. Lifting rings attached on these series compressors due to quarries and some markets need to use compressor so it help you to lift the compressor one to another place by forklift or crane.

High effiency Cooling fan is new generation. it effects to cooling system even in so hot ambience.

The tension of the belt is kept in a constant tension with the automatic tensioning system due to the heating of the compressor and belt. Last of all, the belt is prevented from skidding and the power loss is minimized.

HEATING SYSTEM

Heating system is optionally served & it protects compressor's parts especially airend against to be damaged by cold ambient temperature.

Lifting Rings

Self Cooling Pulleys

Belts are protected from detrition due to the self cooling pulleys.

Filtration

There are 2 stage filtration in compressors which provides seperation of dust and air.

Suction Filter
 Panel Filter

MAX EFFICIENCY & SAFETY

You can get all fault, service and maintenance reports by Electronic smart control unit also it provide to work syncronise between two compressors simultaneously. All these specificatons are standart in all of our compressor series. Our compressors are coated by powder paintings that is stainless and durable against deformation.

Air compressors used to provide maximum quality, pure air so we use prefiltration and secondary heavy service filters. These types of filters provide inlet air by blocking or minimizing dustparticles. Belt tensioning is automatically maden by belt driven series Airenergy compressors. The belt is kept in constant tension with the automatic tensioning system, due to the belt that is extending by the heating of the compressor.

Asymmetrical profiled rotors are made of steel.

Rotors are the main component of the rotary screw air compressors composing screw unit of the compressor. Rotor rotation speed (RPM) is kept at lowest level in order to provide increased lifespan for the screw unit.

Wibration Free

55 kw and 75 kw series belt driven series air compressors that use POLY V type belt are highly safe and efficient Our company use these types of belts and it has minimized fault. It has easy to carriage and installation by lift rings that is mounted on air compressor. The motor and airend groups are fitted on a single chasis, which is connected to bottom tray by vibration wedges in all of our compressors. Consequently, the vibrations of compressor is prevented completely by the way it works without any vibration.

DD SERIES

Direct Drive Rotary Screw Air Compressors

Dong Lifetime

The most important advantage of direct-driven series air compressors is that it has long life time. Motor and airend are coupled directly in Direct Driven Series air compressors. The loads on the bearings are quite low and it has much longer-life bearings in this type of compressors. Disadvantage of this type of compressors is that their pressures cannot bechanged. It is usually used in connection with 1:1 or with transmission connection.Direct coupled compressors are durable and have a long service life, noice level is lower than the belt driven series. The motor and airend groups are fitted on a single chasis, which is connected to bottom tray by vibration wedges in allof our compressors. Consequently, the vibration of compressor is prevented completely by the way it works without any vibration.

Both motor and airend are assembled (coupled) directly in Direct Driven Series air compressors. The loads on the bearings are quite low and it has much longer-life bearings in this type of

compressors. Disadvantage of this type of compressors is that their pressures can not be changed. It is usually used in connection with 1:1 or with gear (transmission) connection. Direct coupled compressors are durable and have a long service life, noise level is lower than the belt driven series.

≫ Silent Technology

Direct Tamsan Driven series air compressors have an extra advantage as silent technology. These types of compressors have not pulleys and belt. For this reason, max RPM of airend is same value with motor RPM. As an advantage, noise level of compressor is minimized. Also the forces on the radial side is eleminated and the bearing life time is extended.

Smart Control System

Air capacity and system temperature are automatically adjusted by Smart Control System. The compressor operates at the constant temperature and it is very easy to control the system. Magnetic field design and distribution of intensity are at reasonable levels. The speed of the engine operating frequency does not affect the working volume of the compressor. Size of the servo motor is equal to the 1/3 of the normal synchronous motor. Therefore, its maintenance is so easy.

EFFICIENCY

COST QUALITY

Minimum Energy Maximum Performance

The most important feature of the Servo rotary screw air compressors are provide energy saving between 20% and 50% compared to stationary star delta rotary screw compressors. These types of compressors provide extra energy savings between 8% and 10% than normal type VSD series rotary screw air compressors. Because, normal type VSD compressors have an asynchronous motor and these motors can reach 88% and 90% efficiency. However, Servo series rotary screw air compressors have synchronous motor. These motors can run up to 96% efficiency. Therefore, they are known as First Class energy-saving motors. The following graphic compares efficiencies of normal type motor with servo motor. Wendel Servo rotary screw air compressors have a structure in which screw unit and high efficient synchronous motor are integrated in air compressors. Also it takes less space due to it has small size and compact design.

(15)

>>

Stable Air Supply

Smart Design Reliable system & easy to maintenance

Constant air supply is provided thanks to the PID controller of the inverter or the inverter's speed adjustment feature. As it can be understood from the figure shown on the right, there is no power transmission element between the rotary screw unit and servo motor. The male rotor shaft of the screw unit is also the shaft of servo motor. For this reason, the efficiency

is at the maximum level. At the same time, the shaft is fixed with the bearing at the rear section of the motor. This ensures the energy saving by reducing friction of the shaft and minimizes the noise level.In addition, the space advantage is provided due to the compact structure of the system.

	Comparison Chart

Air Compressor Room Layout

Install Your Compressor Systems in to Seperate Room of your Facility

There are several reasons for keeping the compressor room separate from your business.

- Ensuring the safety of yourself and your employees.
- Keeping your compressor away from dust and particles in your facility.
- Keeping the noise of the compressor out of your employees.

(18)

VSD SERIES

VSD Rotary Screw Air Compressors

VARIABLE SPEED

The Inverter series compressors are frequency controlled. Thus They adjust the engine speed according to needs of your facility and can provide you up to 35% energy savings compared to load-unload type compressors. if explain, we assume that air consumption is about 6 m³/min and the capacity of existing load-unload compressor is 9 m³/min, the compressor will spend extra energy by using all of the engine power during operation. The situation is a slightly different in the inverter type compressors. Inverter series air compressors are constantly keep the compressor at the pressure value which is set for the compressor by reducing or increasing the engine power with the frequency controller. Thus the compressor will operate according to instant air consumption need of the facility. Inverter systems can be applied both belt driven and direct driven air compressors.

..............

and surgery and the surgery s

FREQUENCY CONTROLLED INVERTER

Inverters provide frequency control of electricity motor by calculating instant air requirement of your facility by using PID control structure, thus it keeps energy consumption at minimum level, by running with low frequencies when air consumption is less, also it runs with high frequencies when air consumption is high.

The most important advantage of frequency converters (VSD) type compressors is to save energy. Direct-drive air compressors provide 35% energy savings. These types of compressors control the energy savings by producing compressed air that the facility needed.

Models & Technical Specifications 11 KW to 250 KW / I SERIES

Model	Capacity [m ³ /min]	Motor [KW/HP]	Connection [inch(")]

TVK 3000 D, TVK 5200 D, TVK 7200 D, TVK 9000 D

Portable Diesel Air Compressors Common Specifications

- DIRECT DRIVE
- VIBRATION FREE CONTINUOUS AIR SUPPLY
- LONG OPERATING LIFE WITH LARGE FUEL TANK
- BALANCED LIFTING ABILITY WITH LIFTING LUGS
- EASY MAINTENANCE WITH DAMPER MOUNTED HOOD
- BEST COOLING THROUGH ALUMINIUM MONOBLOCK RADIATOR
- SOFT AND EASY TRANSITION BETWEEN LOAD-UNLOAD
- COMLIENT TO TRAFFIC REGULATIONS TOWBARS,
- SIGNALS, TRAILER WITH BRAKE
- VIBRATION PADS
- 2 x 3/4" OUTLET VALVE

Filter Pollution Warning

T- MKE series dryers, show the filter change time through internal sensors with warning lamp.

T-MKE Series Dryers

Air dryers run with environment friendly gases. The dryers are equipped with special exchangers operates without noise and vibration.

Operation Principle

The dryers run by circulating a special gas having cooling feature through internal compressors integrated inside the frame similar to the refrigerators. The moisture within the air is separated by condensing the air passing through the system that is cooled up to +3°C. The moisture, which turns into droplets, are automatically discharged from the system.
